

# Binarization

이진영

# DPCM Based Encoder

# Binarization

- Conversion of data into binary numbers, such as 0 and 1
- Generation of bitstream in compression, but thresholding in other domains, such as an edge map
- Various styles for the binary code generation, for example,
  - Fixed-length codes, such as 000, 001, 010, 011, 100, 101, 110, 111
  - Unary codes, such as 0, 10, 110, 1110, 11110, 111110, 1111110, 1111111
  - ...

# Fixed-Length Codes (4bits)

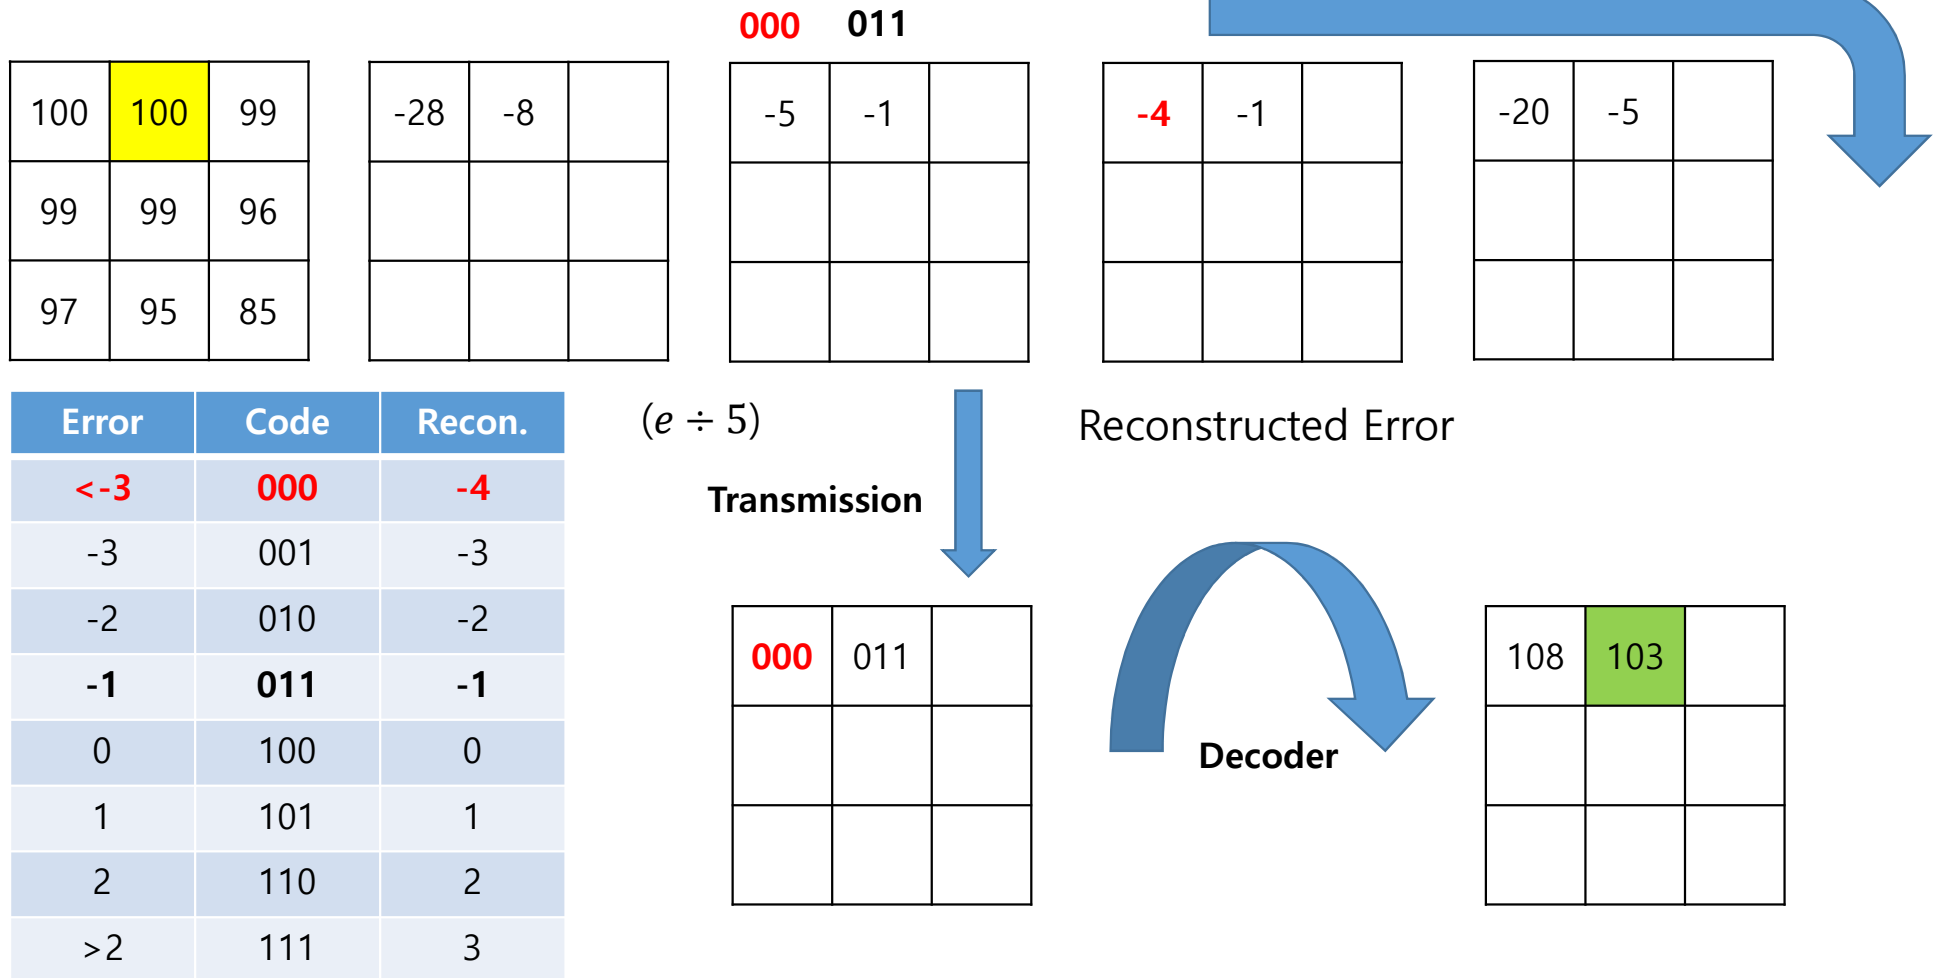

- Binary code using the same number of bits for each data
- Opposite of variable-length codes

Number	Code	Recon.
<-6	0000	-7
-6	0001	-6
-5	0010	-5
-4	0011	-4
-3	0100	-3
-2	0101	-2
-1	0110	-1
0	0111	0

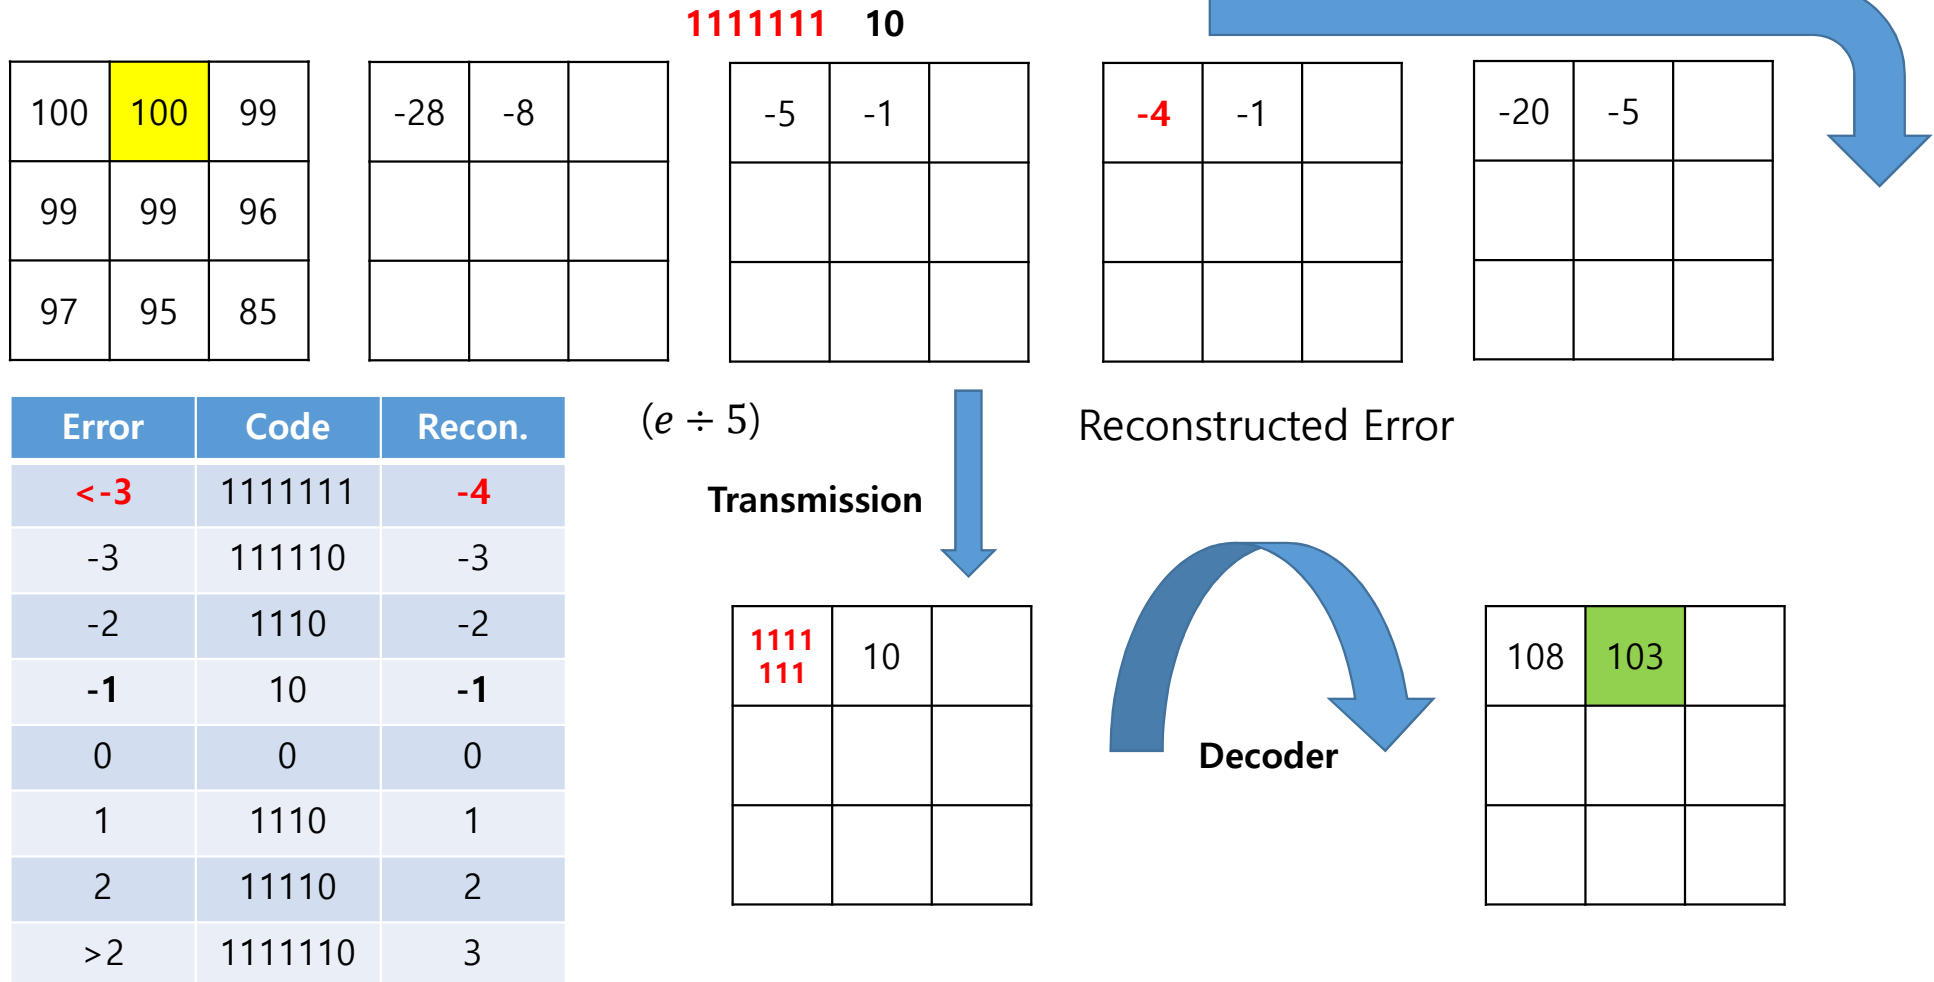

Number	Code	Recon.
1	1000	1
2	1001	2
3	1010	3
4	1011	4
5	1100	5
6	1101	6
7	1110	7

# Result

$q = 5, \text{PSNR} \cong 23.82\text{dB}$

$q = 10, \text{PSNR} \cong 23.17\text{dB}$

In general,  $q \uparrow \rightarrow \text{PSNR} \downarrow$ , but not always our experiments due to the limitation of binarization

# Experiment (Assignment#5)

- DPCM-based compression on AlCenterY.bmp
- Calculation of prediction error, based on horizontal prediction and/or vertical prediction
- $e \div q$  for quantization
- Generation of bitstream with binarization (bitstream.txt), for example,  $<-3(000)$ ,  $-3(001)$ ,  $-2(010)$ ,  $-1(011)$ ,  $0(100)$ ,  $1(101)$ ,  $2(110)$ ,  $>2(111)$ , and then Inverse binarization with  $000(-4)$ ,  $001(-3)$ ,  $010(-2)$ ,  $011(-1)$ ,  $100(0)$ ,  $101(1)$ ,  $110(2)$ ,  $111(3)$
